

What is a **whitelist of charging cards** ?

A 'whitelist' of charging cards refers to **an authorised list of charging cards that are allowed to use (for free) a specific charging infrastructure**. The principle of a whitelist is based on the idea that **only the charging cards on the list are allowed to access electric vehicle charging at a particular location**.

By establishing a whitelist, operators of charging systems or charging points can restrict charging access to specific charging passes. This can be useful in situations where a particular charging infrastructure is intended for specific users, such as company employees, subscription holders or members of a specific network.

With a whitelist, unauthorised users or charging cards can be barred, which helps prevent misuse or unauthorised use of charging infrastructure. It provides additional security and ensures that only authorised users can access electric vehicle charging at a specific location.

Managing a whitelist is done manually on the My Mobiflow platform, with charging cards being manually added or removed from the list.
